Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to:

- Find the best tech solution to solve existing business problems.

- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.

- Define features, development phases, and solution requirements.

- Provide specifications according to which the solution is defined, managed, and delivered.

```
                    ●

          Create a new account or
          sign in to existing account

          Link all financial accounts
          and way of expending

          User can add expenses if
          missed by the auto-tracking
          system of the application

                                              ◇
                                         Un-tracked
                                          expenses

  Notify user and suggest                                      Display user's expenses
  expense saving techniques                                    graphically and provide
                                                               customer support

                    Track and list all
                    transactions done by the
                    user in real-time

                    ◎
